

Feature Change Report

Skanda Design Studio update for Dr. Ranjith Neuro site

Generated: 17 May 2026, 12:47 PM

Completed Changes

- Updated the footer credit from TechDr / techdr.in to Skanda Design Studio across all HTML pages.
- Removed visible booking and appointment CTAs from the navigation, header button area, hero buttons, service CTAs, sticky appointment buttons, and repeated page CTA blocks by wrapping the original code in HTML comments.
- Removed the booking page from sitemap and lms references so search crawlers are not encouraged toward the disabled booking route.
- Added local SEO service-area metadata across pages for Manikonda, Puppalguda, Shaikpet, Narsingi, Kokapet, Gachibowli, Financial District, Jubilee Hills, Tolichowki, and Hyderabad.
- Added site-wide responsive stability CSS for mobile typography, footer wrapping, logo sizing, long text wrapping, hidden empty header CTA area, and disabled sticky booking styling.
- Improved performance readiness with lazy loading on non-critical images, high priority for the logo, deferred scripts already preserved, hidden non-essential preloader overlay, and retained homepage hero image preload.

Validation Summary

Check	Result
Visible booking links	0 found by HTML parser
Visible TechDr text or techdr.in links	0 found by HTML parser
Malformed lazy-loading attributes	0 found
Local server smoke test	index, services, contact, our-doctor, medical-tourism pages returned HTTP 200
Browser visual QA	In-app browser blocked local URLs in this session; local static and HTTP validation completed instead

SEO Notes

- The added service-area meta signal supports nearby discovery around the clinic locality and adjacent Hyderabad neighborhoods.
- The sitemap cleanup prevents a disabled booking page from receiving crawl priority.
- The existing medical schema and geo tags remain in place; the new local-service-areas tag strengthens neighborhood targeting without rewriting page intent.

Performance Notes

- A perfect 100 score depends on the deployed hosting, compression, cache headers, and third-party network timing. The code is now better prepared for Lighthouse/PageSpeed by reducing render blockers and layout instability.
- For the live domain, rerun PageSpeed Insights after deployment and confirm server-side cache/compression headers are active.

Primary Files Updated

All root HTML pages, css/custom.css, sitemap.xml, and llms.txt.
