

PageSpeed SEO Challenges and Fixes Report

Site: <https://drranjithneuro.com/>

Issues Found

- Non-crawlable placeholder links: many anchors used href="#", which Lighthouse SEO can report under crawlable links.
- Viewport restricted zoom: every page used maximum-scale=1, which can reduce Lighthouse accessibility scoring.
- Duplicate page title: contact.html had two title tags.
- Missing image alternative text: blogs.html article thumbnail images had empty alt attributes.
- Performance hosting risk: .htaccess had long cache lifetimes but did not include explicit compression/security/cache-control headers.
- Live report challenge: automated access to the live domain returned bot verification, and the PageSpeed API request returned HTTP 429 during verification. This can make PageSpeed reports show stale or bot-check content until hosting/CDN rules are corrected.

Fixes Applied

- Replaced href="#" placeholders with real destinations: internal pages, tel:+919848999917, WhatsApp, and real social URLs.
- Removed maximum-scale=1 from all viewport meta tags so users can zoom normally.
- Removed the duplicate contact.html title tag.
- Added descriptive alt text to blogs.html article images.
- Added .htaccess compression rules for HTML, CSS, JS, JSON, XML, and SVG via mod_deflate/mod_brotli.
- Added cache-control and security response headers in .htaccess for static assets.

Local Validation

Audit	Result after fix
Non-crawlable href="#" anchors	0 found
Missing image alt attributes	0 pages
Duplicate/missing title tags	0 issues
Viewport zoom restrictions	0 pages
Smoke-tested local pages	index.html, contact.html, blogs.html, 404.html returned HTTP 200

Remaining Live Challenges

- The PageSpeed URLs provided test the deployed live website, not the local files. Scores will not change until these edited files are deployed.
- Clear CDN, hosting, and browser cache after deployment because PageSpeed may reuse cached assets while the report URL still shows old scores.
- Allow Google PageSpeed/Lighthouse user agents through bot protection. If the server sends a bot verification page to Google, PageSpeed measures that challenge page instead of the real homepage.

- Performance 100 is sensitive to live server response time, third-party scripts such as Google Tag Manager/fonts, image transfer size, and cache/compression headers. The code and .htaccess are prepared, but final proof must be on the live host after deployment.
